Apply filters to SQL queries

Project description

I used sql to investigate login attempts and employee info. I used filters to find specific employee info including failed log in attempts and employee records

Retrieve after hours failed login attempts

I used sql to find failed login attempts that happened after 6 pm I filtered the login attempts after 18:00:00 and used success = 0

Retrieve login attempts on specific dates

I used sql to retrieve login attempts from may 8, 2022 and may 9 2022 i used the OR operator because the login attempt could have occurred on either date

Retrieve login attempts outside of Mexico

I used sql to retrieve login attempts that occurred outside of mexico. I used NOT and LIKE with the pattern MEX% to exclude countries that started with MEX

Retrieve employees in Marketing

I used SQL to retrieve employees who work in the marketing department and are located in the east office i used AND because both conditions needed to be true

Retrieve employees in Finance or Sales

I used SQL to retrieve employees who work in either the finance or sales department i used the OR operator because an employee could be in either department

Retrieve all employees not in IT

I used SQL to retrieve employees who do not work in the information technology department i used the NOT operator to exclude employees in that department

Summary

I used SQL filters to investigate login activity and employee information. I used WHERE AND, OR, NOT, and LIKE to find specific information, such as failed login attempts, login attempts on certain dates, and employees in specific departments
